

`std::false_type`

`std::true_type`

`utils::is_template
_instance< Tmpl, Tmpl
< Ts... > >`

```
graph BT; A["utils::is_template< Tmpl, Tmpl< Ts... > >"] --> B["std::false_type"]; A --> C["std::true_type"];
```

The diagram illustrates a function call. At the bottom, a gray box contains the code `utils::is_template_instance< Tmpl, Tmpl< Ts... > >`. Two blue arrows originate from this box: one points to a white box labeled `std::false_type` on the left, and the other points to a white box labeled `std::true_type` on the right. This represents the function returning one of these two types based on its argument.
